Sample: Dispatcher report · michalgorski.com: articles, admin panel, assistant

2026.10.10

This is a sample artifact from an AI-driven delivery process, attached to the article "AI SDLC: cheaper code & new risks to manage". The Dispatcher, an AI agent that plans the work and runs coding sub-agents, wrote it at the end of the run. The original was in Polish; this is an English translation. Repository links, server details and internal paths are removed.

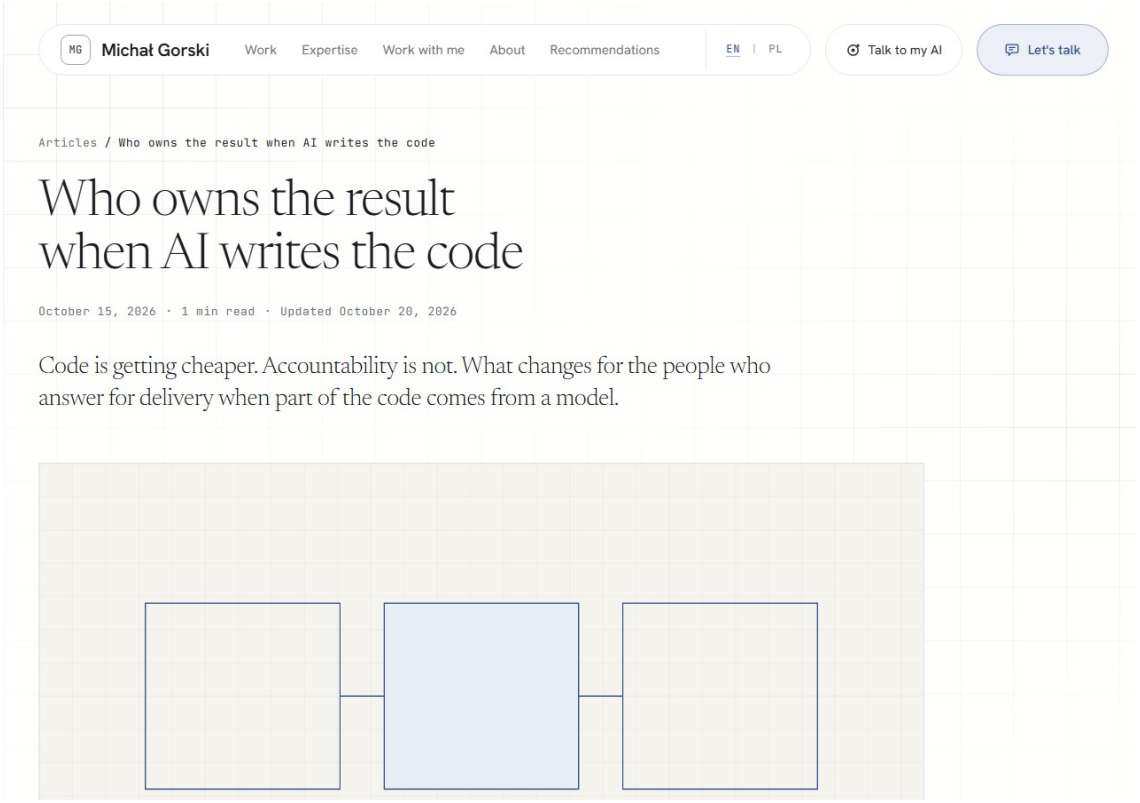

Features A, B and C are in production. The articles section is hidden behind ?articles=on; no article has been uploaded or published yet.

One question (Q6) and decisions you may still change: type your answer in the grey box. An empty box on a decision D means it stays.

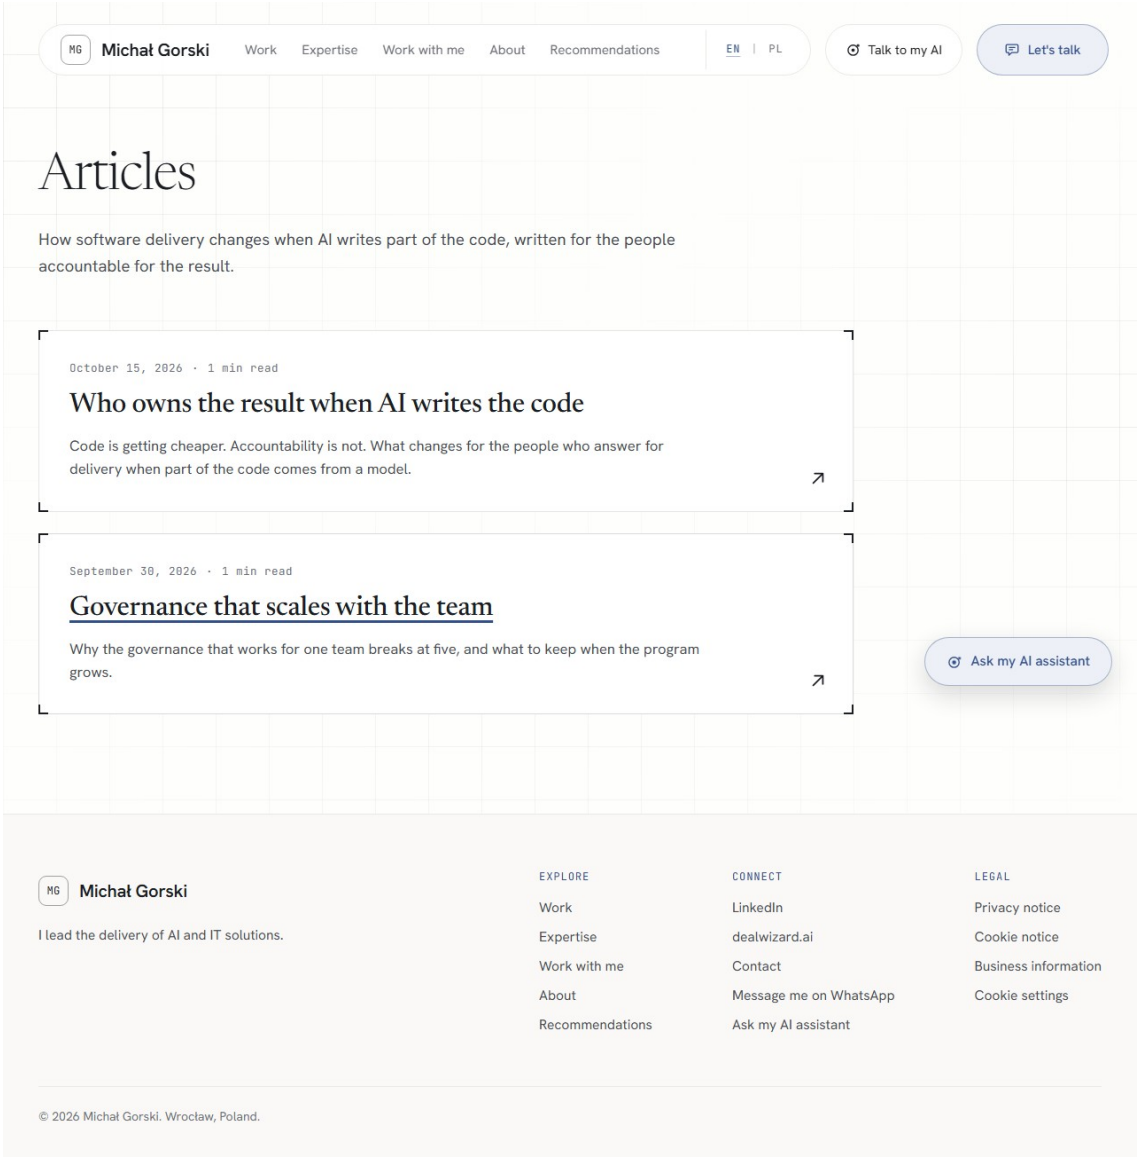

Done

A. Articles section (PR #126)

- /articles, /articles/<slug>, /pl/artykuly, /pl/artykuly/<slug>, images under /articles/media/. Rendered on request, so publishing needs no deploy.
- Without ?articles=on: 404 (the Polish path gets the Polish 404). With the flag: 200, noindex, no-store, and links carry the flag. Not in navigation, sitemap or llms.txt. Checked in production.
- JSON-LD Article and BreadcrumbList, hreflang EN/PL from translationOf; the EN | PL switch in the header leads to the translation.

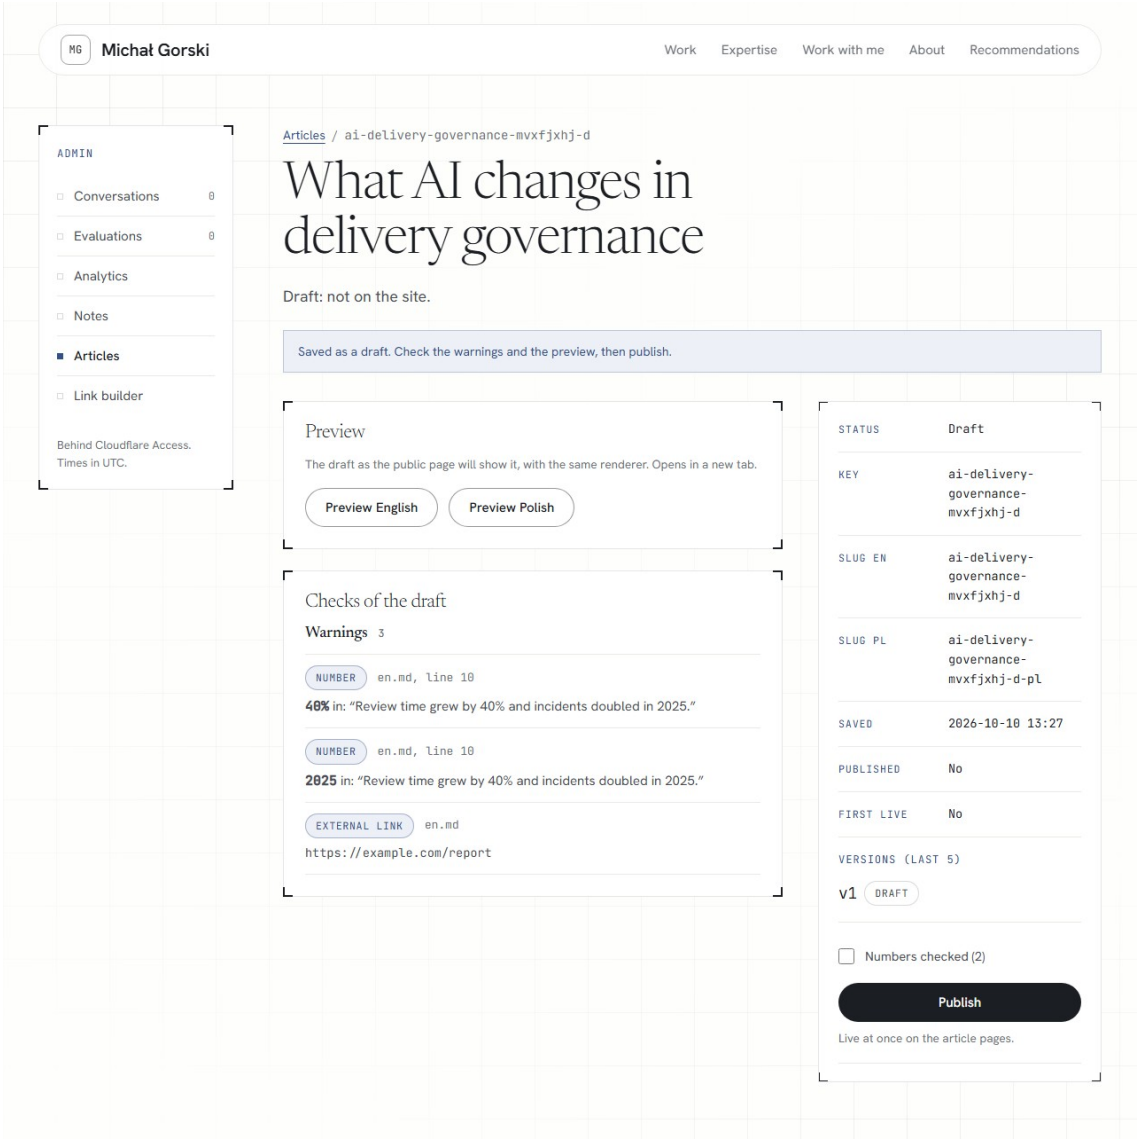

Article page after the fix (no Read in Polish link), test data

Articles index, test data

C. Admin panel (PR #125)

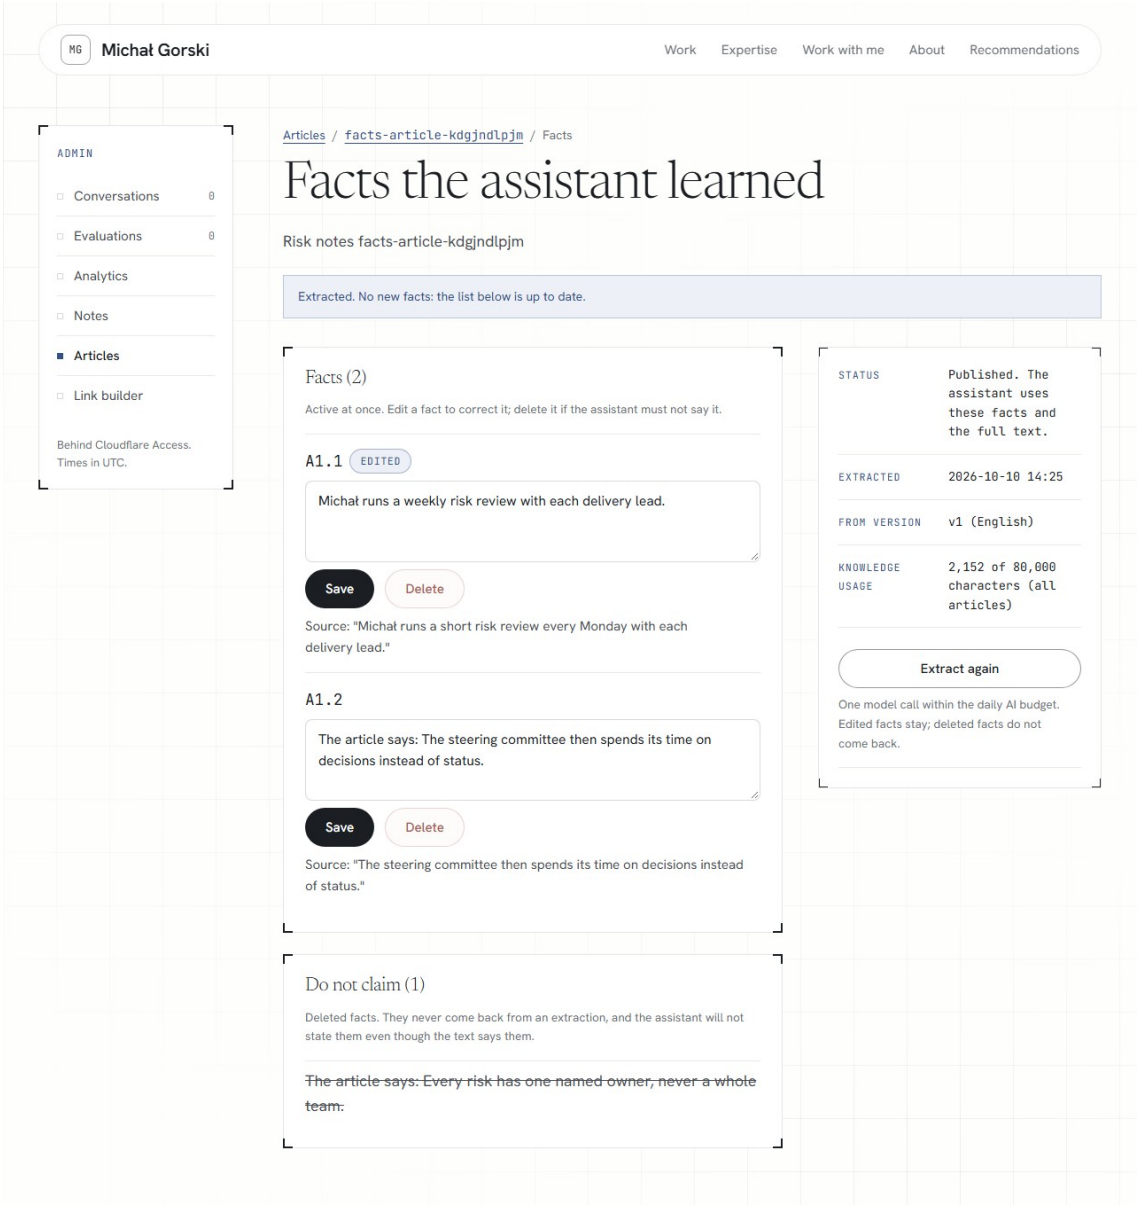

- /admin/articles: a list, drag in .md files and images or a .zip (one request up to 5 MB on this route only; the rest of the server keeps its 64 KB limit, and 70 KB on the contact form returns 413 in production).
- Validation on upload: required fields, em dashes, forbidden phrases, images and alt text, reserved slugs. Numbers and external links show as warnings; Publish requires ticking Numbers checked.
- Draft preview in the same view as the public page, Publish goes live at once, Unpublish, 5 versions kept.
- Locally: an article check command, article templates and an article-package skill (PR #124).

A draft in the panel: warnings about numbers, Numbers checked, Publish

B. The assistant learns from articles (PR #127)

- The full text of published articles goes into the assistant's knowledge (a safety cap of 80 thousand characters, newest first), plus up to 12 facts extracted automatically after publishing.
- An email to you with the list of facts and a link to the facts page: edit, delete, Extract again. A deleted fact goes on the Do not claim list.
- A link to the article appears in the assistant's answers only after the section is switched on publicly.
- The assistant's daily cap: 2 USD (your decision in Q5). Evaluation on the real model with a sample article: 5 of 5, cost 0.0273 USD.
- New assistant wording (the ARTICLES rule, the extraction prompt) is quoted word for word in the pull request description.

Facts the assistant extracted, test data

Fixes after review (PR #128)

- Removed the Read in Polish / Read in English link (your note from the screenshots). The header switch already led to the translation.
- Cause of a flaky test: on Windows, renaming a fresh folder waits 2 to 3 seconds for the antivirus scanner. Fixed at the source.
- Ready for the public switch: IndexNow with the sitemap served by the release, a header test with the Articles item (it caught a 47 px overflow, fixed).

Production

- 4 releases, each with a live check of 294 of 294, no rollback.
- CI: 13 runs, about 142 job minutes; 1 red (Polish header at 1024 px), 1 auto-merge stopped by a conflict, 1 cancelled.

New sentences on the site (visible only with ?articles=on)

EN: Articles; Articles | Michał Gorski; How software delivery changes when AI writes part of the code, written for the people accountable for the result.; I have not published an article yet.; min read; All articles; Ask the assistant about this article.

PL: the same sentences in Polish.

For your decision

Q6. Do you accept the sentence under the articles index heading?

In the first questions document (Q1) you did not choose a sentence. For now the proposal stands, marked in the code as waiting for your approval. It is visible only with ?articles=on.

- **A. I accept it (recommended)**: "How software delivery changes when AI writes part of the code, written for the people accountable for the result." (and its Polish version)
- **B. My own sentence**: Type it in English and Polish.
- **C. No sentence**: Only the Articles heading.

Q6 · Your answer (a letter, your own text, or paste a picture)

D8. Contact link from the article page

Status: implemented

I chose: from=direct: The list of from values in the contact form is your closed list, so I did not add a new one.

Alternatives:

- **B. A new value from=article**: You would see in the enquiry that someone came from an article.

D8 · Keep it? Empty = keep. Or an alternative letter or your own text

D9. An article without a translation

Status: implemented

I chose: The EN | PL switch leads to the articles index in the other language: The same way the switch works today on pages without a translation.

Alternatives:

- **B. Hide the switch on such an article**: Fewer clicks into nothing, but the header looks different from the rest of the site.

D9 · Keep it? Empty = keep. Or an alternative letter or your own text

Switching the section on publicly (navigation, sitemap, llms.txt, indexing): one configuration value and a release. Your decision, once the article is ready.

Backlog: retrieval (RAG) once there are many articles; comments under articles with your answers.

The article: you upload it in the admin panel as a draft, check the preview and publish it after your yes. The Dispatcher does not publish it.

Failures (with cause)

Tooling: the default Python on the machine was a store placeholder, so the document script ran only with another interpreter and UTF-8 output set explicitly.

Tooling: a safety hook blocks the file-writing tool outside the working copy, so status files were written through the shell.

A Read in Polish link under the lead duplicated the header switch. Cause: my brief for the articles package asked for it, and I showed the screenshots after the deploy instead of before the merge. It sat behind the flag, so no visitor saw it.

Parallel packages: conflicts in the shared open-items file stopped one auto-merge (+8 minutes of CI), and a union merge mixed up the order of the decision log. One agent took another package's pull request description from a shared scratch folder (description corrected).

A red CI run: the Polish header at 1024 px ran 5 px past the margin, because Linux in CI renders labels wider than Windows.

Not checked in production: an answer from the assistant (it needs a bot-protection token and there is no smoke script). Two tests are sometimes unstable under heavy load; out of scope, noted for the next run.
